

Finance & Business Operations

Medivac.ai Platform

SOP-BUS-001

Operational procedures for invoicing, fee reconciliation, contract compliance, ISO management, and reporting across the Royal Flying Doctor Service South Eastern Section.

Document ID	SOP-BUS-001
Organisation	RFDS South Eastern Section
Owner	Chief Financial Officer / Director of Business Operations
Author	Perplexity Computer
Version	Draft 2
Date	July 2026
Review due	July 2027
Status	DRAFT — Uncontrolled when printed

1 Purpose and Scope

This Standard Operating Procedure (SOP) defines how RFDS South Eastern Section Finance, Senior Management, and Business Operations staff use the Medivac.ai platform to manage the commercial and compliance functions of the aeromedical operation. It establishes consistent, auditable workflows so that financial and business activity is accurate, timely, and defensible under external scrutiny.

1.1 Purpose

The purpose of this procedure is to standardise the use of Medivac.ai for invoicing, fee reconciliation, contract compliance, ISO document management, government tender administration, payroll and leave support, and statutory reporting. Adherence ensures that revenue is captured against every completed mission, that contracted rates are correctly applied, and that the organisation meets its obligations as a registered charity and health-services contractor.

1.2 Scope

This SOP applies to the following roles and activities:

- Finance staff — invoice generation and despatch, fee reconciliation, financial-records retention, payroll extracts, and ACNC reporting inputs.
- Senior Management — approval of invoices and contracts, review of cost optimisation and KPI dashboards, and board and management-review reporting.
- Business Operations staff — contract register maintenance, tender submissions, ISO 9001 document control, non-conformance management, and internal-audit coordination.

1.3 Out of Scope

Clinical governance, aircraft airworthiness and maintenance record-keeping, and flight-crew rostering are governed by separate operational SOPs and are referenced here only where they provide source data (for example, completed mission records that trigger invoicing).

Currency and tax convention

Unless otherwise stated, all monetary values in this SOP and in Medivac.ai are expressed in Australian Dollars (AUD) and are exclusive of Goods and Services Tax (GST). GST is applied at the point of invoice generation in accordance with prevailing Australian Taxation Office requirements.

Navigation Update (July 2026)

Demand Forecasting and Airborne EFB have been moved out of the Business navigation group. Demand Forecasting is now under Missions; Airborne EFB is now under Assets. This SOP covers Finance & Business modules only: Invoicing, Fee Reconciliation, Cost Optimizer, Government Tenders, ISO Compliance, Contract Compliance, and Payroll & Leave.

2 Invoicing

Invoicing in Medivac.ai is driven by completed mission records and contracted rate cards. All invoices must pass an Operations sign-off before despatch and are tracked to settlement.

2.1 Generating invoices from completed mission records. Once a mission is marked complete in Medivac.ai, its record — aircraft type, block hours, route, and client — becomes available in the invoicing queue. Finance staff select the record and the platform pre-populates a draft invoice using the applicable rate card.

2.2 Charter invoice workflow. For charter missions, confirm the client, apply the correct aircraft hourly rate, and attach the mission reference. The invoice line items are derived from block hours multiplied by the aircraft rate; adjustments (e.g. positioning legs, ground handling) are added as discrete lines with supporting notes.

2.3 NEPT batch invoicing. Non-Emergency Patient Transport missions billed to government health departments are consolidated into a monthly batch. Medivac.ai groups eligible NEPT records, validates them against the health department schedule, and produces a single batch invoice with a supporting line-level manifest.

2.4 Invoice approval workflow. Every invoice enters an approval state requiring Operations sign-off before despatch. The approver confirms that the mission occurred as recorded and that rates are correct. No invoice may be despatched from Medivac.ai without a recorded approval.

2.5 Invoice status tracking. Each invoice carries a status of Draft, Sent, Paid, or Overdue. Finance monitors the status dashboard, follows up overdue invoices, and reconciles payments received against the ledger.

2.6 Pricing convention. All prices are quoted in AUD exclusive of GST. GST is calculated and displayed separately on the final tax invoice.

Status	Meaning	Required action
Draft	Created, not yet approved	Complete details, submit for sign-off
Sent	Approved and despatched to client	Monitor payment terms
Paid	Payment received and reconciled	Close and file
Overdue	Past agreed payment terms	Escalate to Finance for follow-up

3 Charter Rates Reference

The Charter Rate Card is the single source of truth for aircraft hourly rates and true airspeed (TAS) planning figures used to estimate mission cost and duration. Rates are reviewed monthly and are expressed in AUD exclusive of GST.

Aircraft	Type	Hourly rate (AUD ex-GST)	TAS (kts)
B200	Beechcraft King Air 200	\$4,000	240
B350	Beechcraft King Air 350	\$4,800	270
PC12	Pilatus PC-12	\$3,200	285
PC24	Pilatus PC-24 jet	\$6,000	440
CL60	Bombardier Challenger 600	\$9,500	460
HELO	Rotary-wing (helicopter)	\$8,500	180

Hourly rates are applied to block time recorded against each mission. TAS figures support flight-time estimation during quoting and cost-optimisation analysis; they are planning values and do not replace operational flight-planning data.

Rate governance

The Charter Rate Card is reviewed monthly. Rate changes are approved by the Chief Financial Officer or Director of Business Operations and version-controlled within Medivac.ai. Invoices always apply the rate current at the mission date.

4 Fee Reconciliation

Fee reconciliation confirms that fees charged and received align with contracted rates. It is performed continuously for charter work and on a scheduled monthly basis for government contracts.

4.1 Reconciling mission fees against contracted rates. Medivac.ai compares each invoiced line against the applicable rate card and contract terms, flagging any variance for review before the invoice is closed.

4.2 Government contract reconciliation. Government contracts are reconciled monthly. Finance validates the volume and mix of missions delivered against contracted commitments and confirms that the platform fee and per-mission charges have been correctly raised.

4.3 Discrepancy identification and resolution. Where a variance is detected, it is logged, categorised (rate error, volume error, data error, or timing), assigned to an owner, and resolved. Resolution notes and any credit or adjustment are recorded against the affected invoice for audit purposes.

4.4 RFDS SE platform contract. The RFDS SE contract rate for the Medivac.ai platform is a base platform fee of \$700,000 per year, billed as \$36,500 per month. This fee is reconciled as part of the monthly government-contract reconciliation cycle.

Reconciliation type	Frequency	Owner
Charter mission fees	Per invoice / continuous	Finance
Government contract volumes	Monthly	Finance
Platform base fee (\$36,500/mo)	Monthly	Finance / CFO
Discrepancy close-out	As raised	Assigned owner

5 Cost Optimizer

The Cost Optimizer module surfaces fleet efficiency insights so that Senior Management can align aircraft selection and routing with cost and clinical needs.

5.1 Reviewing fleet cost efficiency reports. Cost per hour, cost per mission, and cost per patient-kilometre are reported by aircraft type, enabling comparison of relative efficiency across the fleet.

5.2 Identifying high-cost mission patterns. The module highlights recurring high-cost patterns — for example, jet tasking on short sectors better suited to a turboprop, or frequent positioning legs — for management review.

5.3 Optimisation recommendations. Medivac.ai generates recommendations on aircraft selection and routing, weighing hourly rate and TAS against mission distance and clinical acuity. Recommendations are advisory; final tasking decisions remain with Operations and clinical governance.

Advisory nature of optimisation

Cost Optimizer outputs support commercial decision-making only. They never override clinical priority, patient safety, or airworthiness requirements, which take precedence over cost considerations in all tasking decisions.

6 Government Tenders

Government tender activity is managed within Medivac.ai from submission through award, transition, and ongoing KPI monitoring.

6.1 NSW Health NEPT tender management. Active and forthcoming NSW Health Non-Emergency Patient Transport tenders are tracked with key dates, requirements, and responsible owners.

6.2 Tender submission workflow. Submissions are prepared in Medivac.ai using controlled templates, routed for internal review and executive approval, and lodged with a full record of the version submitted.

6.3 Contract award tracking and transition planning. On award, the contract is registered and a transition plan — mobilisation, resourcing, and reporting set-up — is tracked to completion.

6.4 KPI monitoring against tender commitments. Committed KPIs are loaded into the platform and monitored against actual performance for the life of the contract.

7 Contract Compliance

Contract compliance ensures that every active agreement is monitored against its obligations, with clear escalation where performance falls short.

- 7.1 Active contract register. Medivac.ai maintains a register of all active contracts, capturing counterparties, term dates, values, and key obligations, providing a single view of contractual commitments.
- 7.2 KPI dashboard. The compliance dashboard tracks on-time performance, clinical outcomes, and reporting obligations against contracted thresholds, with trend indicators to identify emerging risks early.
- 7.3 Non-compliance escalation. Where a KPI breaches its threshold, an escalation is raised, assigned, and managed to resolution. Material or persistent breaches are escalated to Senior Management and, where required, reported to the contracting authority.

KPI category	Example measure	Monitoring
On-time performance	% missions departing within window	Continuous
Clinical outcomes	Adverse-event and handover metrics	Monthly
Reporting obligations	Reports lodged by due date	Per obligation

8 ISO Compliance

Medivac.ai supports the organisation's ISO 9001 quality management system through controlled documentation, non-conformance management, internal audit scheduling, and management-review preparation.

8.1 ISO 9001 document control. Controlled documents are held in Medivac.ai with version history, approval records, and review dates. Only the current approved version is available for use; superseded versions are archived.

8.2 Non-conformance management. Non-conformances are raised, investigated for root cause, actioned with corrective and preventive measures, and formally closed out with evidence retained.

8.3 Internal audit scheduling. Internal audits are scheduled against the annual audit programme, with scope, auditor, and findings recorded in the platform.

8.4 Management review data preparation. Quality data — audit results, non-conformance trends, KPI performance, and customer feedback — is compiled from Medivac.ai to support periodic management reviews.

9 Audit & Reports

Medivac.ai is the source for operational, regulatory, and governance reporting.

9.1 Monthly operational reports. Monthly reports cover missions flown, fleet utilisation, and revenue, providing a consolidated view of operational and financial performance.

9.2 CASA audit preparation. Documentation required for Civil Aviation Safety Authority audits is exported directly from Medivac.ai, ensuring a complete and consistent evidence pack.

9.3 Board reporting pack. A quarterly board reporting pack consolidates financial, operational, and compliance data for governance review.

10 Payroll and Leave

Medivac.ai supports workforce administration through leave management, payroll data extraction, and enterprise agreement compliance.

- 10.1 Leave management. Leave requests are submitted, approved or rejected, and tracked within the platform, maintaining accurate leave balances and an auditable approval trail.
- 10.2 Payroll export. A structured data extract is produced for the payroll system each cycle, capturing hours, allowances, and leave for processing.
- 10.3 EBA compliance. Payroll and rostering data are checked against the applicable enterprise agreements to ensure entitlements are correctly applied.

Enterprise agreement	Group	Currency
Pilots EBA	Flight crew — pilots	2025
Nurses EBA	Clinical — flight nurses	2023
Engineering EBA	Aircraft maintenance engineering	2025

11 Compliance

As a registered charity delivering health services under government contract, RFDS SE carries statutory obligations that Medivac.ai helps to evidence and meet.

11.1 Financial records retention

Financial records are retained for the periods required under Australian taxation and corporations legislation. Medivac.ai maintains invoices, reconciliations, and supporting documentation in an accessible, auditable form for the retention period.

11.2 ACNC reporting

Reporting to the Australian Charities and Not-for-Profits Commission (ACNC) — including the Annual Information Statement and associated financial reporting — is supported by data extracted from Medivac.ai, ensuring consistency between operational records and regulatory submissions.

11.3 Health contract obligations

State and federal health-contract obligations — including service-level, reporting, and data-provision requirements — are tracked against each active contract, with compliance evidenced through the platform's contract-compliance and reporting functions.

Document control

This is a DRAFT document (Draft 2, July 2026) and is UNCONTROLLED WHEN PRINTED. The authoritative version is the controlled electronic copy held in Medivac.ai. Verify the current version before relying on any printed or downloaded copy.

11.4 Version history

Version	Date	Change
v1.0	July 2026	Initial draft release of SOP-BUS-001.
v1.1	July 2026	Updated: Navigation restructure note — Demand Forecasting and Airborne EFB relocated.
